

Lead the way with Compass

Key Attributes:

- Aggressive growth, ideal for boot stage blends or an early maturity soft dough crop
- White flowered for better palatability and digestibility
- Earlier flowering, shorter season than most other ProGene spring forage peas
- Higher seed yield
- Normal leaf type pea

ProGene Plant Research is pleased to present Compass, an aggressive shorter season spring pea. It has great short season yield, and fits well in a boot or an early soft dough blend. It has good seed yield.

Forage:

Compass does well in a boot or early soft dough blend. It can also be used alone to increase nitrogen fixation in your soil. It can also be used as a more aggressive variety in a relay crop.

Bio Cover Crop:

Compass does well as a spring cover crop; its early and quick growth makes it excellent as a short term cover if you plan on planting a later season crop.

Wildlife Plantings:

Research has shown that having both a winter pea and a spring pea in a wildlife planting improves the durability of the plot under fall deer grazing pressure. Compass gives a strong early growth which will pair well with a slower growing winter pea.
